## Notes on interpretation (PLO-specific)

- **VPIP / PFR gap** is usually **larger** in PLO than in NLHE because more players limp/call speculative hands. Huge gaps (25%+) indicate passive / fishy tendencies.
- **3-bet ranges** in PLO are typically tighter and more polarized (premium double-suited + high connectivity) than in Hold'em.
- **C-Bet stats** should be interpreted relative to board texture; good regs adjust frequency significantly, while fish have more static tendencies.
- **WTSD vs W\$SD**: Stations have high WTSD but lower WSD because they call too light; NITs have low WTSD but very high WSD because they only go with the nuts.
- **Aggression** for maniacs can be misleading: they bet every street but also overplay junk. Look at positional stats and turn/river AF for better reads.
